Oceano Dunes State Vehicular Recreation Area (ODSVRA)

San Luis Obispo County

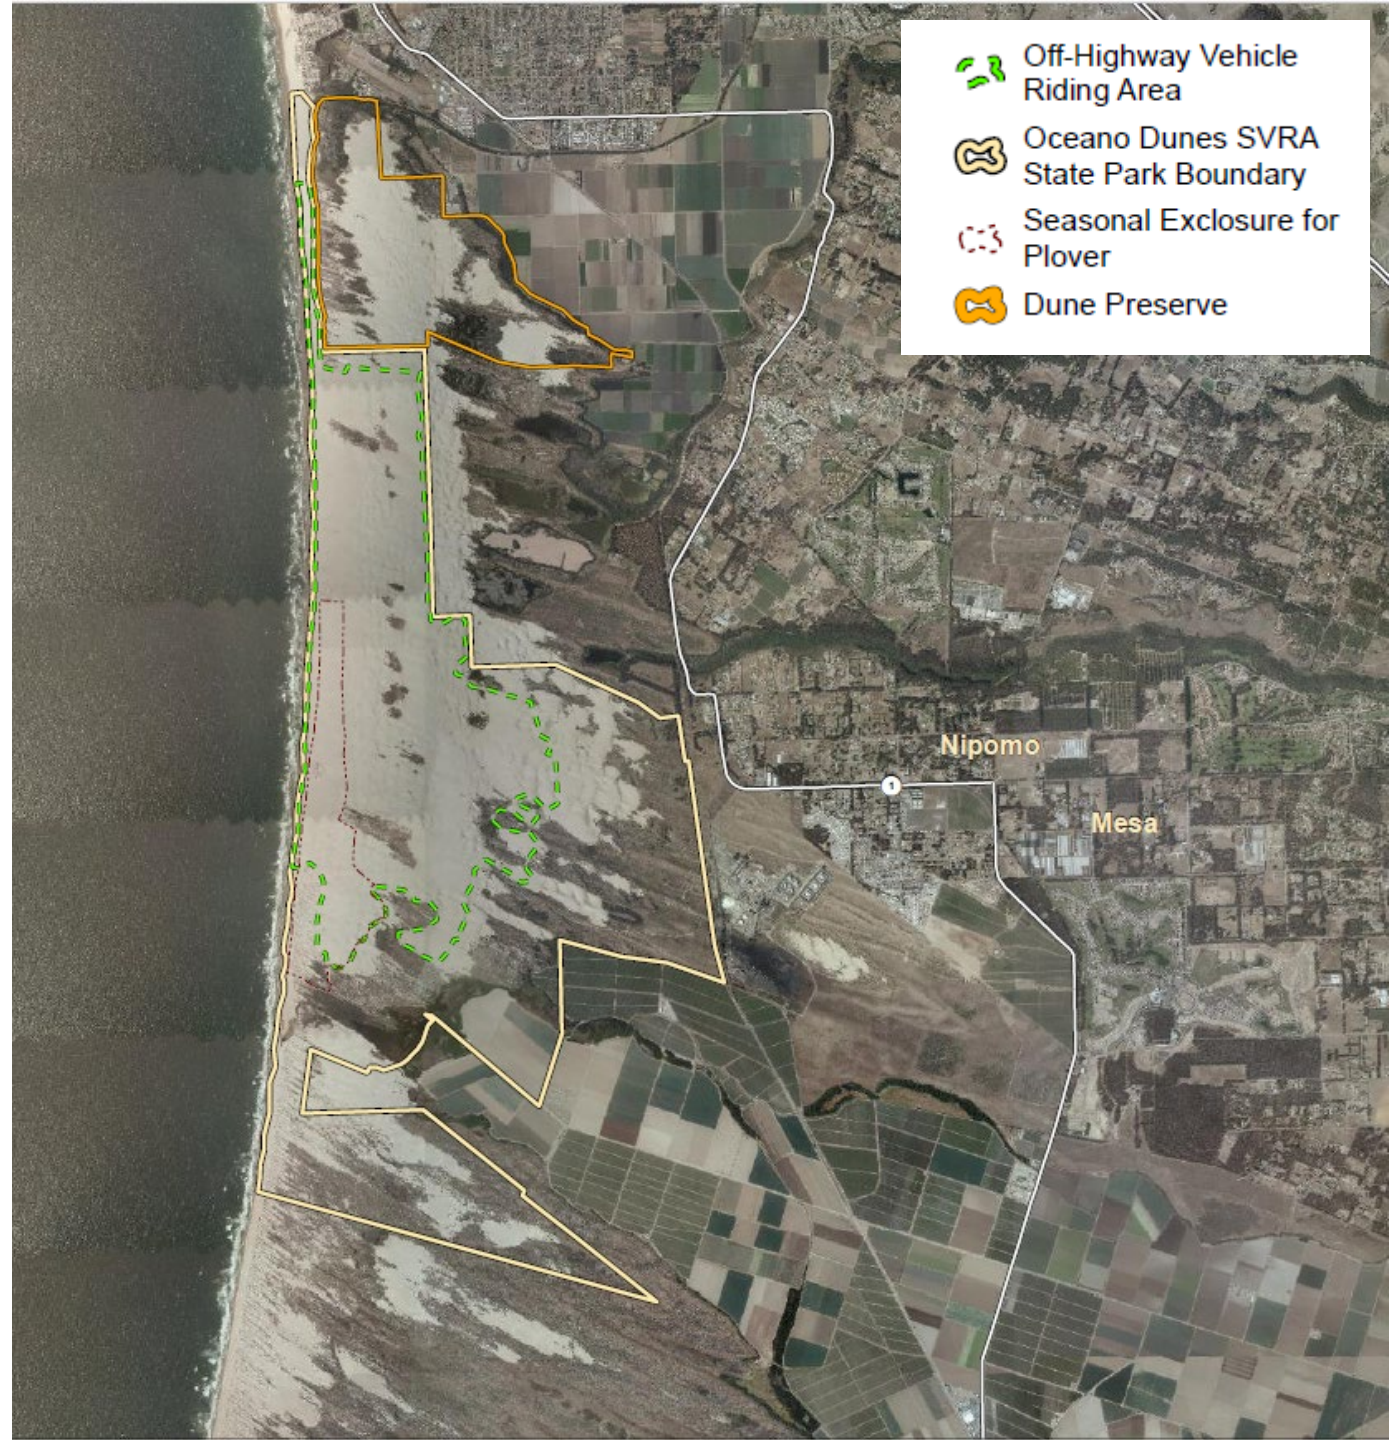

ODSVRA

6 mi

ODSVRA

- Calif. State Park, est. 1982
- 5.5 square miles / 3,600 acres
- Day use: \$5; Camping \$10/night
- 1.6 millions visitors/year
- Up to 2,580 **vehicles/day**
 - Street legal + ATVs, dune buggies, etc.
- Up to 1,000 “camping units” per night (pre-COVID)

-  Off-Highway Vehicle Riding Area
-  Oceano Dunes SVRA State Park Boundary
-  Seasonal Exclosure for Plover
-  Dune Preserve

“Huckfest” 2013

ODSVRA Tour

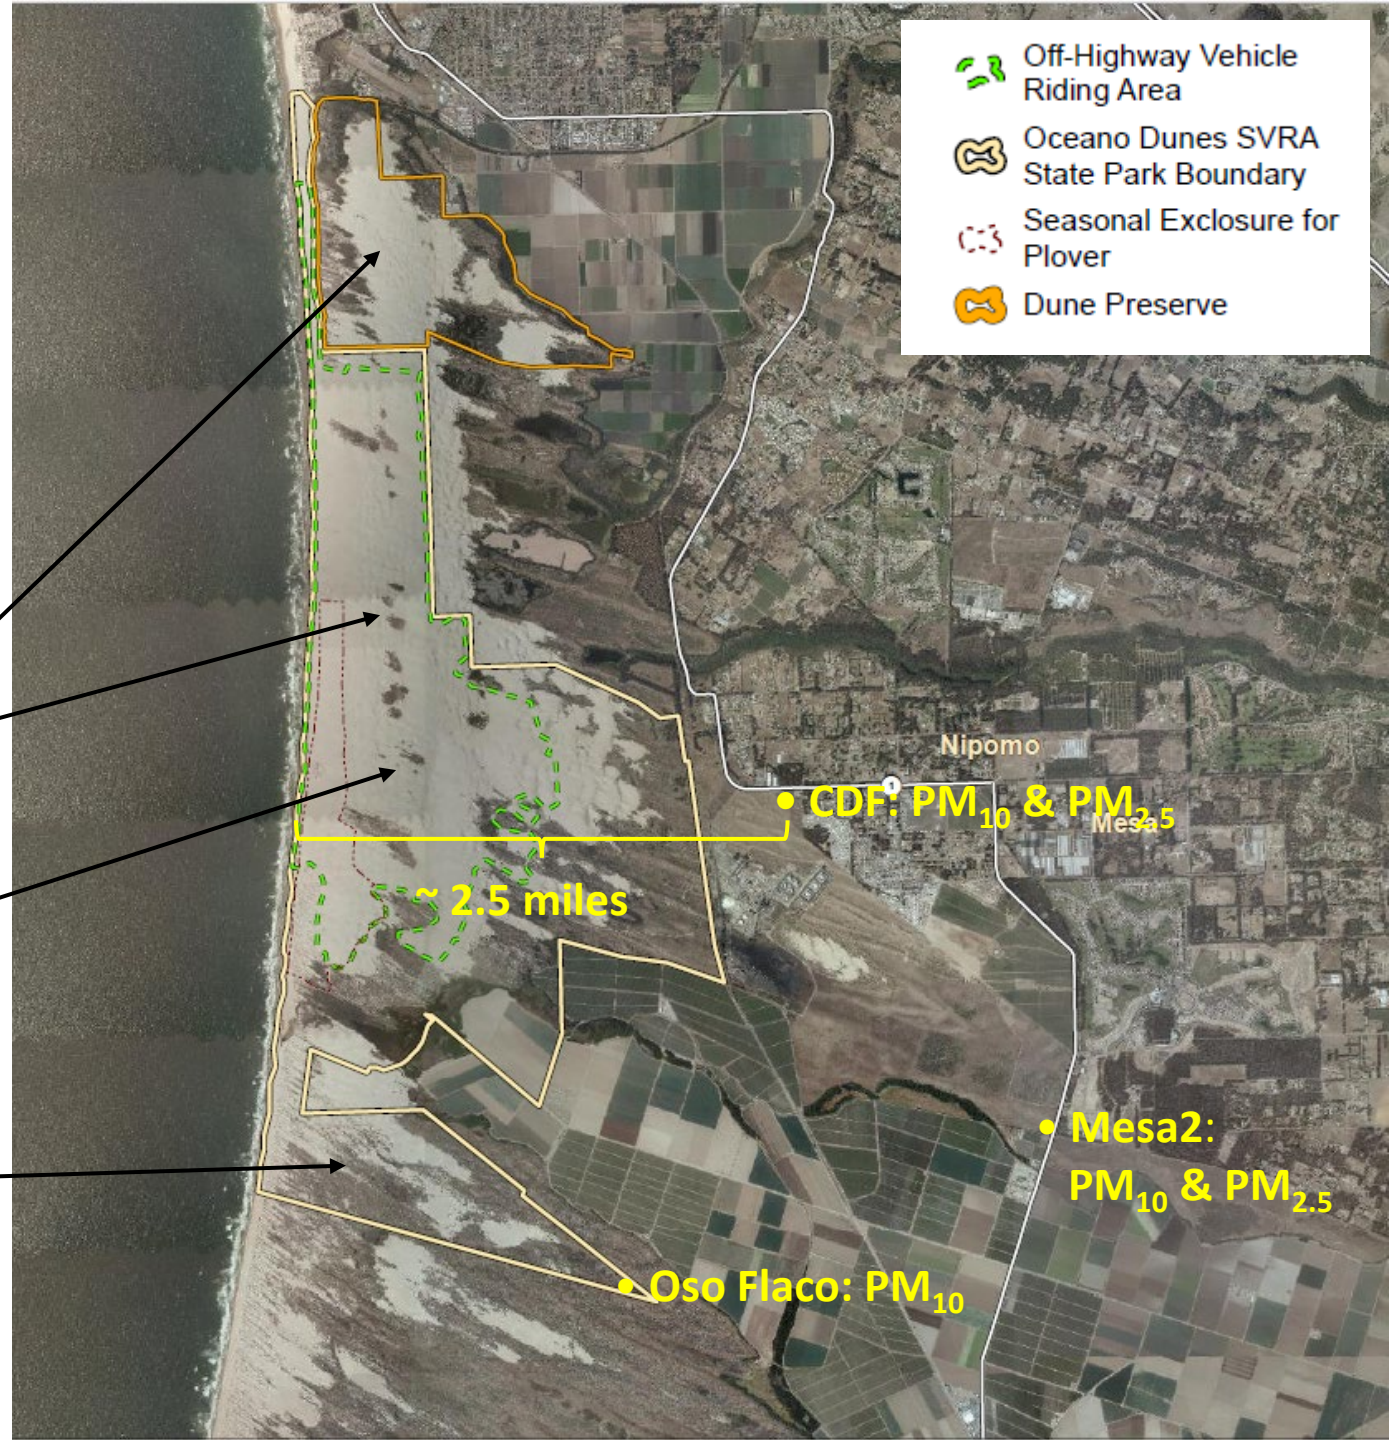

-  Off-Highway Vehicle Riding Area
-  Oceano Dunes SVRA State Park Boundary
-  Seasonal Exclosure for Plover
-  Dune Preserve

Dune Preserve – 700 acres, riding prohibited (orange)

ODSVRA – 3,600 acres total (yellow)

Riding Area – 1,500 acres (green dashes)

Oso Flaco area – riding prohibited

Effects of Off-Roading on the Dunes

Vegetation change 2010 vs 1939

Dune PM₁₀ Emissions vs Wind Speed

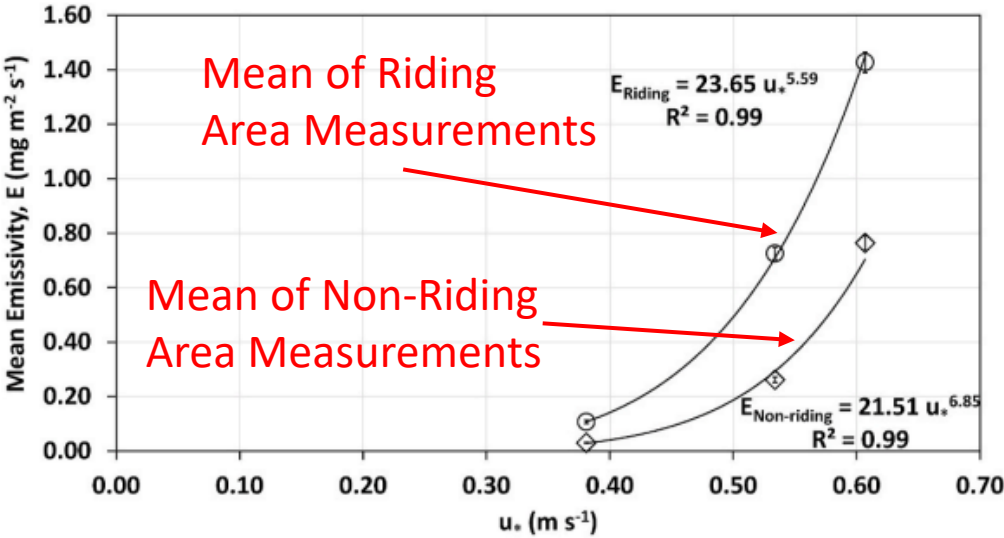

Fig. 9. The relation between mean E ($\text{mg m}^{-2} \text{s}^{-1}$) and u_* (m s^{-1}) for the amalgamated data from 2013 to 2019 for the riding (circles) and non-riding areas (diamonds). Error bars represent the standard error of the estimate (standard deviation/ $(\# \text{observations} - 1)^{0.5}$).

Gillies, J. A., Furtak-Cole, E., Nikolich, G., Etyemezian, V. (2022). "The role of off-highway vehicle activity in augmenting dust emissions at the Oceano Dunes State Vehicular Recreation Area, Oceano, CA," Atmospheric Environment: X, 13, <https://doi.org/10.1016/j.aeaoa.2021.100146>

Meteorology

CDF, May 2015

Typical Wind Event

CDF, May 29, 2022. 24-hr PM₁₀: 92 µg/m³

Plume from 4/28/2011

CDF 24-hr PM₁₀: 135 µg/m³
CDF peak hour: 442 µg/m³

Annual Exceedances of Calif. PM₁₀ Standard

California PM₁₀ Std: 50 µg/m³ over 24 hours

Brief History of APCD Involvement

- 2007 “Phase 1 Study”
- 2010 “Phase 2 Study”
- 2011 Local Rule 1001, *Coastal Dunes Dust Control Requirements*
- 2013 South County Community Monitoring Study
- 2017 Hearing Board Petitioned, Case 17-01
- 2018 Stipulated Order of Abatement in Case 17-01 (SOA)
- 2019 SOA Amended
- 12+ Lawsuits from off-road advocates

How Have Dust Controls Affected PM₁₀ Downwind?

Acres of Dust Controls Within the ODSVRA
(from 2021 ARWP Attachment 1)

CDF Wind roses for May, 2010 - 2017

How Have Dust Controls Affected PM₁₀ Downwind?

PM₁₀ Downwind of the Oceano Dunes

- Usual sources
 - Background (aerosols, traffic, sea salt)
 - Wildfire smoke (Aug – Oct 2020, 2017)
 - Regional Dust (e.g., Oct 2019)
- Wind-blown dust (saltation derived)
 - Influenced by:
 - ODSVRA Dust Control Projects
 - Winds

How Can We Disentangle Effects Of Mitigation And Meteorology?

- Difference-in-differences approach (DiD)
 - Inspired “parallel-ness” of CDF and Mesa2 trends
 - Idea from observational economics – 2021 Nobel Prize Economics (David Card)
 - Uses analogous experimental unit to implicitly control for other variables

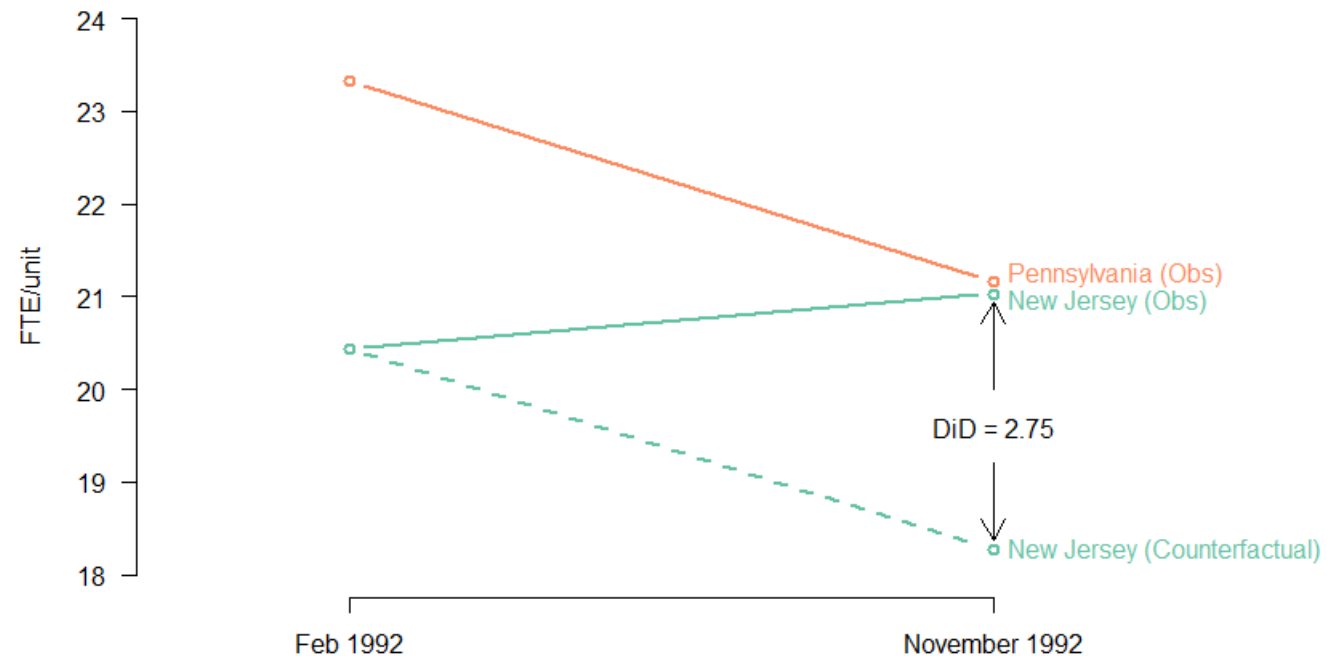

DiD Example: Card & Krueger (1994) (From Wikipedia)

Effect of minimum wage increase on fast food employment

- April 1992 – NJ minimum wage increased from \$4.25 to \$5.05
- NJ FTE/restaurant
 - Feb (before change): 20.44
 - Nov (after change): 21.03
 - $\Delta_{NJ} = 21.03 - 20.44 = +0.59$
 - **Was change due to wage increase or weather, seasonality, macroeconomic variables?**
- PA FTE/restaurant
 - Feb (before change): 23.33;
 - Nov (after change): 21.17
 - $\Delta_{PA} = 21.17 - 23.33 = -2.16$
 - **No wage increase in PA, but other factors should affect PA about the same as NJ**
- Assume change in NJ would have been same as PA were it not for intervention (i.e. wage increase)
 - **DiD estimate = $\Delta_{NJ} - \Delta_{PA} = 2.75$**

Δ FTE/restaurant

Applied to ODSVRA

Assumptions:

- Inter-annual variations in meteorology have same effect on PM_{10} trends at CDF and Oso Flaco
- Trends in non-ODSVRA sources impact CDF and Oso Flaco similarly
- Changes in mitigations affects CDF but not Oso Flaco.

Applied to ODSVRA

- Look at 24-hr PM_{10} from only “wind event days”, to filter out “noise”.
 - Wind Speed within ODSVRA at 3 pm > 21 mph
 - Wind Direction at CDF at 1 pm from 289 - 360 deg
 - Remove any days impacted by wildfire smoke or dust transported from San Joaquin Valley (n = 1)
- Log transform PM_{10} data to Gaussian distribution
- Use 2017 as “baseline year” for all comparisons

Applied to ODSVRA

- Essentially...
 - Calculate $\log(\text{CDF PM}_{10}) - \log(\text{Oso Flaco PM}_{10})$ for every wind event day
 - Equivalent to $\log(\text{CDF PM}_{10} / \text{Oso Flaco PM}_{10})$
 - *First difference*
 - Perform *t*-test comparing logged PM_{10} ratios of year of interest to baseline year (2017)
 - *Second difference—the difference in differences*
- In practice...
 - Analyze data using R software package
 - Use generalized least squares (nlme::gls) to explicitly account for:
 - temporal autocorrelation
 - non-constant variance from year to year
 - Get p-values and confidence intervals

```
Generalized least squares fit by REML
Model: log(cdf/oso) ~ contrasts
Data: dd.events

Quantifying Mitigation Effectiveness at CDF

Log(CDF PM₁₀ / Oso Flaco PM₁₀)

2017

2018

**Acres of Dust Controls Within the ODSVRA
(from 2021 ARWP Attachment 1)**

Quantifying Mitigation Effectiveness at CDF

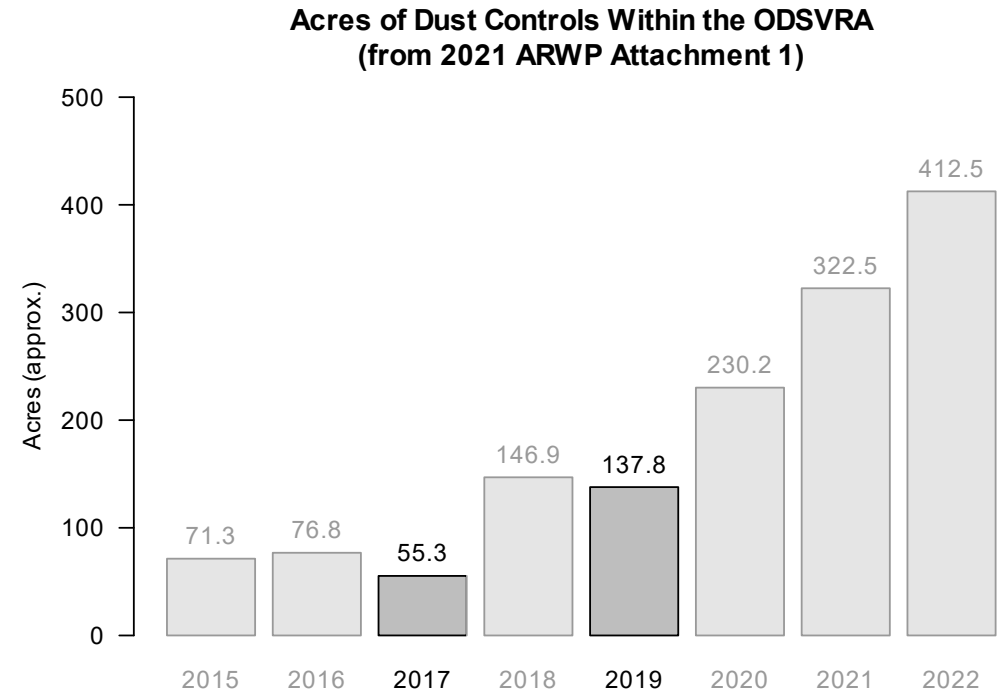

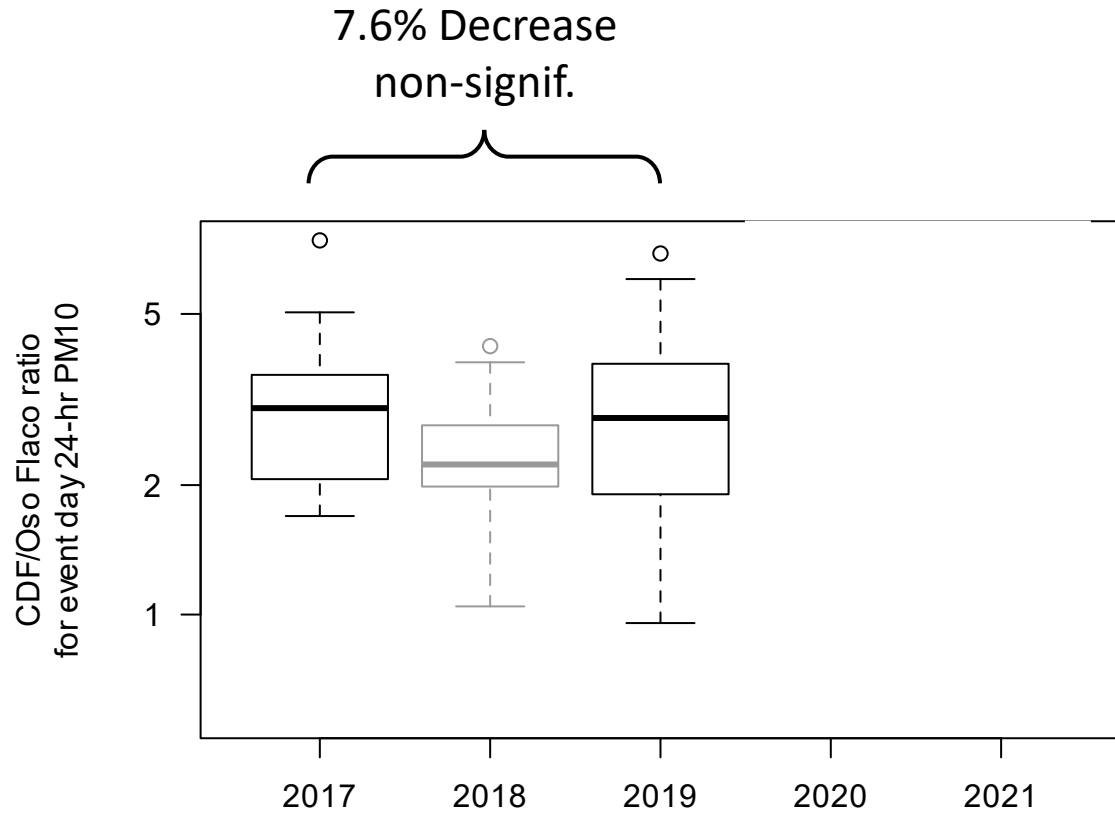

22.4% Decrease
p-value = 0.006

Acres of Dust Controls Within the ODSVRA
(from 2021 ARWP Attachment 1)

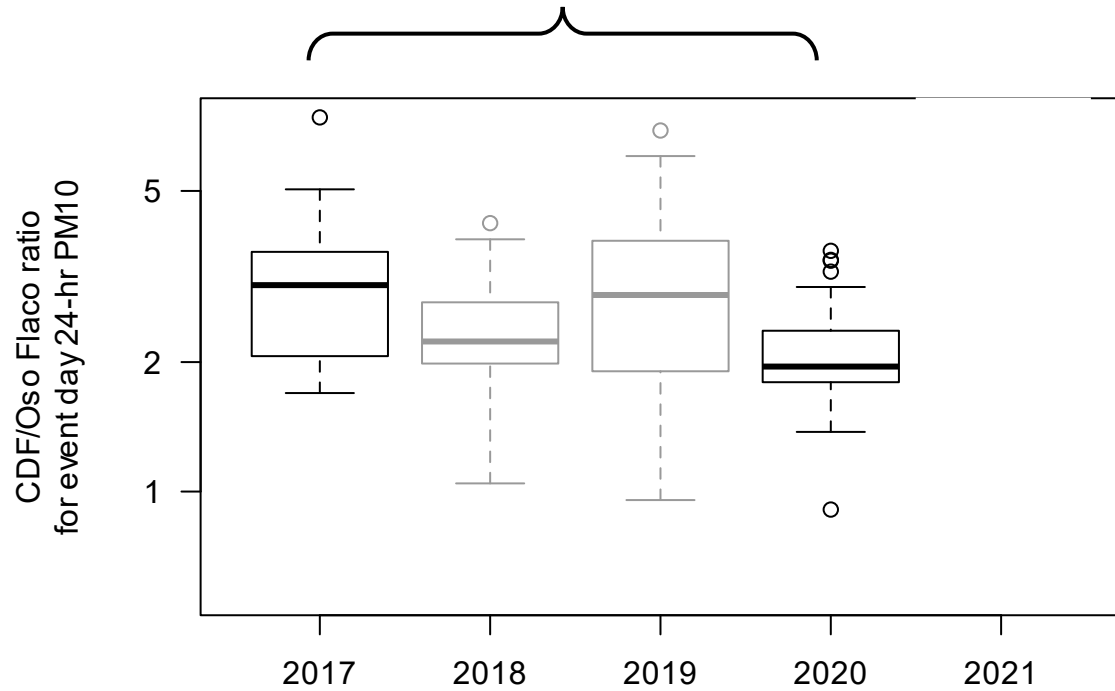

Quantifying Mitigation Effectiveness at CDF

Quantifying Mitigation Effectiveness at CDF

28.4% Decrease
p-value: 0.0007

Acres of Dust Controls Within the ODSVRA
(from 2021 ARWP Attachment 1)

Quantifying Mitigation Effectiveness at CDF

33.5% Decrease
p-value: 0.0009

Acres of Dust Controls Within the ODSVRA
(from 2021 ARWP Attachment 1)

Change, vs 2017 baseline, in Ratio of Wind-Event-Day PM₁₀ (CDF vs Oso Flaco)

Year	Total Dust Mitigation Extent (approx. acres)	Percent Change	95% Confidence Interval	P-value
2021	322.5	- 33.5%	-16.1% to -47.3%	0.0009
2020	230.2	- 28.4%	-13.9% to -40.4%	0.0007
2019	137.8	- 7.6%	+23.2% to -30.7%	0.593
2018	146.9	- 22.4%	-7.4% to -34.9%	0.006
2017	55.3	- 0 %	n. a.	n. a.

Comparison To Modeling

Difference-in-Differences

- 2021 vs 2017
 - 33.5% reduction in PM₁₀
 - 95% CI: 16.1 to 47.3%
- 2020 vs 2017
 - 28.4% reduction in PM₁₀
 - 95% CI: 13.9% to 40.4%

Langrangian Dispersion Model

- 2021 vs 2017
 - 42.1% reduction in PM₁₀
- 2020 vs 2017
 - 41.9% reduction
- Desert Research Institute / Calif State Parks

What Does This Mean?

- In 2021: 56 Wind Event Days
- Actual median wind-event-day PM_{10} at CDF: $52 \mu\text{g}/\text{m}^3$
- Predicted median without change: $77 \mu\text{g}/\text{m}^3$

What Does This Mean?

- In 2021: 56 Wind Event Days
- Actual median wind-event-day PM₁₀ at CDF: 52 $\mu\text{g}/\text{m}^3$
- Predicted median without change: 77 $\mu\text{g}/\text{m}^3$

What Does This Mean?

- In 2021: 56 Wind Event Days
- Actual median wind-event-day PM₁₀ at CDF: 52 $\mu\text{g}/\text{m}^3$
- Predicted median without change: 77 $\mu\text{g}/\text{m}^3$

Median PM10 downwind of ODSVRA
before and after mitigation

What Does This Mean?

- In 2021: 56 Wind Event Days
- Actual median wind-event-day PM₁₀ at CDF: 52 $\mu\text{g}/\text{m}^3$
- Predicted median without change: 77 $\mu\text{g}/\text{m}^3$

What Does this mean?

- In 2021: 56 Wind Event Days
- Actual median wind-event-day PM_{10} at CDF: $52 \mu\text{g}/\text{m}^3$
- Predicted median without change: $77 \mu\text{g}/\text{m}^3$

Median PM_{10} downwind of ODSVRA before and after mitigation

Difference-in-differences estimate:
 $\sim 25 \mu\text{g}/\text{m}^3$ or 33.5% reduction.

Summary

- Off-riding enhances PM₁₀ emissions from the Oceano Dunes
- Extent of dust mitigations have steadily increased, currently >400 acres
- Variations in meteorology complicate interpretation of monitoring data
- Difference-in-differences approach implicitly controls for inter-annual variations in meteorology and impacts of non-dunes sources
- DiD analysis shows 33.5% improvement in wind-event-day PM₁₀ levels downwind, 2017-2021
 - Corroborated by modeling
